

Squeezing Every Mile Out of Every Gallon

by **RUSS**  **MOORE**

TRANSMISSION SPECIALIST

We at Russ Moore would like to help our customers “squeeze every mile out of every gallon of gasoline”, in these times of high gas prices.

So we have provided this to help our customers with some proven ways to help you save money & increase your car or trucks gas mileage;

Have your vehicle's computer system scanned and check the TAP & CVI values. These will tell you if the transmission is starting to slip.

Check that the torque converter lock-up system is working correctly to make sure that the lock-up is coming on and controlling the slippage properly.

Also remember these very important points that will ensure you are getting the best possible gas mileage out of your vehicle;

Check your tire pressure's regularly (everytime you fill up). Running on low or uneven tire pressures will increase the work your engine has to do and use more gasoline (the recommended pressures can be found on your drivers door jam). Check your wheel alignments and your vehicles air filter. All these items will lead to higher gas consumption.

Service Advise

Watch your top speed. Even small increases in your road speed can mean much larger increases in engine power required, thus you will consume considerably more gasoline.

Buy the "Cheap Gas". Don't pay for the premium gas unless your vehicle manual recommends it.

After market "Fuel Saving" devices are a waste of time on fuel injected cars and trucks. Given a week or two the vehicles computer will have retuned the fuel mixture back to where it belongs anyway.

Keep your engine regularly tuned up. This will reward you when filling up at the pump.

We are always focused on helping our customers get the best out of their vehicles.

Should you have questions, one of our service managers will be pleased to help.
